Proc. Natl. Acad. Sci. U.S.A. 83:4499-4503(1986).
-!- FUNCTION: ACCESSORY PROTEIN FOR MHC CLASS-II ANTIGEN/T-CELL RECEPTOR INTERACTION. MAY REGULATE T-CELL ACTIVATION.
-!- SUBURIT: ASSOCIATES WITH P56-LCK (BY SIMILARITY).
-!- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
-!- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
-!- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
-!- SIMILARITY: BELONGS TO THE IMMUNOGLOBULIN SUPERFAMILY. CONTAINS ONE V-LIKE AND 3 C2-LIKE DOMAINS.

It can also be used in the treatment of lung disorders to improve blood circulation in the lung and/or gaseous exchange between the lungs and the blood stream or to improve blood circulation to the heart and 02 gas permeability in cases of cardiac insufficiency, to improve blood flow and gaseous exchange in chronic obstructive airway disease, or to treat malabsorptive syndromes in the intestinal tract. Quantitation of VEGF-D in cancer biopsy specimens may be useful as an indicator of future metastatic risk. Antagonists can be used for treating e.g. conditions such as congestive heart fallure, involving accumulations of fluid in the lung resulting from increases in vascular permeability. The products can also be used for datection and diagnosis

                                                                                                                                                                                                                                                                                                                          (lymph)angiogenesis. The proteins are also used to identify specific binding agents (potential therapeutic agents) and to raise antibodies. The antibodies are useful as therapeutic (ant)agonists; for detection, purification and targeting of proteins for in vivo or in vitro diagnosis (including imaging) or for therapy (including when linked to e.g. a label or cytotoxin); and for immunotyping of cells, e.g. for detecting minimal residual disease or haematopoietic progenitor/stem cells. It is also contemplated that the sequences might be useful for treating a very wide range of other disorders, e.g. autoimmune diseases; altergy; cancer; infectious diseases (viral, bacterial, fungal or parasitic); neurodegeneration, also as chemotactic agents or for stimulating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence is vascular endothelial growth factor-D (VEGF-D), which is an angiogenic protein of the invention. The angiogenic proteins and the DNA sequences encoding them, are used to prevent, treat or ameliorate disease and to detect diseases, or susceptibility, by detecting mutations or the presence or amount of angiogenic protein expression. Particularly they are used to stimulate wound healing, growth of damaged bone and tissue, and for repair of vascular tissue, especially peripheral arterial disease, critical limb ischaemia or coronary disease. Antagonists of the sequences are used to inhibit angiogenesis in tumours and to treat inflammation (where associated with increased wascular permeability) dishatic retipocathy.
                                                                                                                                                                                                                                                                         Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          increased vascular permeability), diabetic retinopathy, rheumatoid arthritis or psoriasis. Agonists are also useful for stimulating

                The present sequence represents a human zvegf2 growth factor encoded by the zvegf2 cDNA which was isolated from a human heart cDNA library. Zvegf2 protein in a dimeric form acts as a mitogen for fibroblasts or smooth muscle cells. zvegf2 is claimed to be useful for stimulating the revascularisation of tissue or the re-endothelialisation of vascular tissue. zvegf2 is particularly claimed to be useful for the treatment of full-thickness skin wounds, including venous stasis ulcers and claimed to be useful as an additive in tissue adhesives for protein is also claimed to be useful as an additive in tissue adhesives for promoting revascularisation of the healing tissue. Antagonists against zvegf2 can be used to block its mitogenic, chemotactic and angiogenic effects. The antagonists may therefore be useful for reducing growth of solid tumours by inhibiting neovascularisation of the developing tumour or by directly blocking through the treatment of diabetic retinopathy, psoriasis,
                                                                                                                                                                                                                               Claim 1;
                                                                                                                                                                                                                                                    New isolated vascular endothelial growth factor - used to develop products for treating e.g. wounds, burns, myocardial infarction, tumours, psoriasis, arthritis, restenosis or organ transplants
                                                                                                                                                                                                                                                                                                                                                                                                           18-SEP-1997;
